Our next Prime Cattle Sale will be on Thursday 6th of October at 07.30am
SPECIAL SHEEP STORE SALE 7TH OCTOBER STARTING AT 10.30AM

DID YOU KNOW

Sheep can reduce water loss by using a heat exchange system in their brain to cool down their blood. The animals can save up to 80% of their daily water intake by using this system. In a structure at the base of their brain, the artery with blood flowing towards the brain divides into many fine blood vessels.

Heat from the arterial blood can transfer out of these fine vessels and into cooler venous blood flowing away from the brain, which can later be cooled by evaporation in the sheep's nose.

This cooling system doesn't ensure protection against overheating of the brain but is actually a water-saving mechanism that works by cooling the hypothalamus, the body's thermostat which is responsible for triggering panting and sweating when it's hot
