*Did you know...*

Signs of heat stress may include animals bunching, seeking shade, panting, slobbering or excessive salivation, foam around the mouth, open mouth breathing, lack of coordination, and trembling. Heat stress is hard on livestock, especially if it is in combination with high humidity and low wind speed. If a bull starts to demonstrate signs of aggression, stop what you are doing, and get out of the pen. Exit slowly and calmly, keeping the bull in sight. Do not turn around and run. Many times, bulls stomp, put their head down, or arch their back before they attack.

Efficient, experienced and quiet handling of livestock, using recommended techniques and facilities, as well as taking measures to eliminate pain and accidental injury, will reduce stress in the animals and prevent quality deficiencies in meat and by-products.
